## EXPLANATORY NOTES

1. This publication contains estimates relating to persons in the civilian labour force and to those persons not in the labour force for New South Wales and regions of New South Wales. The estimates have been derived from the labour force survey component of the monthly population survey, which is conducted on a sample basis throughout Australia.

2. Statistics similar to those contained in Tables 1, 8, 9, 11 and 14 of this publication are published each month, as they become available, in Monthly Summary of Statistics (1305.1) which is available, on request, from this Office. Other data contained in this publication are also available each month (except for (a) the occupation, industry and status of worker details for employed persons, which are available only on a quarterly basis; and (b) regional estimates, which although available each month will be released only on a quarterly basis). In addition, other unpublished data may be available. These data, if required each month as they become available, may be obtained from this Office.

3. The monthly population survey. This survey consists of the monthly labour force survey and, in most months, one or more supplementary survey topics. From February 1978, the survey has been conducted each month. Previously, the survey was conducted in February, May, August and November of each year. The information is obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers. The interviews are generally conducted during the two weeks beginning on the Monday between the 6th and 12th of each month. The information obtained relates to the week before the interview (i.e. the survey week).

4. Survey sample. The monthly population survey is based on a multi-stage area sample of private dwellings (houses, flats, etc.) and non-private dwellings (hotels, motels, etc.) and covers about one-half of one per cent of the population of New South Wales. The survey sample is reselected after each quinquennial Census of Population and Housing. The reselected sample of dwellings based on 1981 Census of Population and Housing results was introduced in the October 1982 survey. Information on sample design and selection is given in the Technical Note in The Labour Force, Australia, 1981 (6204.0).

5. Population benchmarks. Labour force survey estimates of persons employed, unemployed and not in the labour force shown in this publication for New South Wales, Sydney Statistical Division and Balance of New South Wales are calculated in such a way as to add up to the independently estimated distribution of the population aged 15 and over by age and sex. This procedure compensates for underenumeration in the survey and leads to more reliable estimates. The independent population statistics (benchmarks) are the latest available estimates at the time the labour force survey is conducted but they usually differ from the official State level population estimates subsequently published in Australian Demographic Statistics (3101.0), because they are necessarily derived from incomplete information about population changes. Regular estimates of population at the regional level are, however, not available. Consequently, the use of benchmarks in estimating the regional data available from this survey is not possible. For this reason, estimates of the civilian population aged 15 and over are not made available at the regional level.

6. Revision of series. Survey estimates are not revised for the usually small amendments of population benchmarks arising from new data on deaths and overseas and internal migration. Revisions are made, however, after each census of population and housing and when population estimation bases are reviewed. Labour force survey estimates back to February 1978 have been recalculated to conform to revised population estimates which take account of the results of the 1981 Census of Population and Housing. Revised estimates back to February 1978, similar to those shown in Table 1, were published in an Appendix to the February 1984 issue of this publication. In addition, following the change in official population estimates to a place of usual residence basis after the 1981 Census of Population and Housing, the population benchmarks used in the derivation of labour force survey estimates are compiled according to place of usual residence. For an explanation of the new conceptual basis of population estimates, see Information Paper - Population Estimates: An Outline of the New Conceptual Basis of ABS Population Estimates (3216.0). To co-ordinate with the new benchmarks, the labour force survey questionnaire was changed in October 1982 to

enable identification of each respondent's place of usual residence. The estimates shown in this publication from October 1982 onwards are thus wholly according to place of usual residence. Prior to October 1982, the estimates are based on a combination of place of enumeration and place of usual residence.

A revised questionnaire was also introduced for the April 1986 survey. Following the introduction of this questionnaire, the definition of employed persons has been extended to include persons who worked without pay between 1 and 14 hours per week in a family business or on a farm (i.e. unpaid family helpers). This new definition aligns the Australian labour force concepts with a set of changed international definitions adopted by the International Labour Office at the 13th Conference of Labour Statisticians in October 1982. Previously, such persons who worked 1 to 14 hours, or who had such a job but were not at work, were defined as either unemployed or not in the labour force, depending on whether they were actively looking for work. Details of this change, together with other changes made to the questionnaire, are contained in Information Paper: Questionnaires used in the Labour Force Survey (6232.0). For Table 1, estimates according to the revised definition have been calculated back to January 1985. However, for the other tables, estimates according to the revised definition are only available from the time of introduction of the new questionnaire in April 1986.

7. Scope. The labour force survey includes all persons aged 15 and over, except:

- (a) members of the permanent defence forces;
- (b) certain diplomatic personnel of overseas governments, customarily excluded from census and estimated populations;
- (c) overseas residents in Australia; and
- (d) members of non-Australian defence forces (and their dependants) stationed in Australia.

8. Labour force concepts and definitions.

(a) The concepts and definitions used in the labour force survey conform closely to those recommended by the International Labour Organisation. The labour force comprises all persons in scope who, during the survey week, were employed or unemployed as defined in Explanatory Notes 8(b) and 8(c) below. The

survey week comprises the seven days preceding the interview week (see Explanatory Note 3 above). The activities of persons in this period of reference are used in determining the classification of those who are employed. In addition to this week, the 3 weeks preceding it are also considered in identifying the unemployed. More detailed definitions of these two groups follow.

(b) Employed persons.

- i. These comprise all civilians aged 15 and over who, during the survey week:
  - worked for one hour or more for pay, profit, commission or payment in kind (including employees, employers and self-employed persons) in a job or business, or on a farm; or
  - worked for one hour or more without pay in a family business or on a farm (i.e. unpaid family helpers); or
  - were employees who had a job but were not at work and were: on paid leave; on leave without pay for less than four weeks up to the end of the survey week; stood down without pay because of bad weather or plant breakdown at their place of employment for less than four weeks up to the end of the survey week; on strike or locked out; on workers' compensation and expected to be returning to their job; or receiving wages or salary while undertaking full-time study; or
  - were employers, self-employed persons or unpaid family helpers who had a job, business or farm, but were not at work.
- ii. These employed persons can be classified into:
  - full-time workers (i.e. those who usually work 35 hours or more a week and others who, although usually part-time workers, worked 35 hours or more during the survey week); and
  - part-time workers (i.e. those who usually work less than 35 hours a week and who did so during the survey week).

Persons who held more than one job are counted only once - in the job in which they worked most hours during the survey week.

(c) Unemployed persons comprise all civilians aged 15 and over who were not employed during the survey week, and:

- i. had actively looked for full-time or part-time work at any time in the four weeks

up to the end of the survey week, and:

- were available for work in the survey week, or would have been available except for temporary illness (i.e. lasting for less than four weeks to the end of the survey week); or
- were waiting to start a new job within four weeks from the end of the survey week and would have started in the survey week if the job had been available then; or

ii. were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than four weeks up to the end of the survey week (including the whole of the survey week) for reasons other than bad weather or plant breakdown.

(d) Actively looking for work includes writing, telephoning or applying in person to an employer for work; answering a newspaper advertisement for a job; checking factory or Commonwealth Employment Service notice-boards; being registered with the Commonwealth Employment Service; checking or registering with any other employment agency; advertising or tendering for work; and contacting friends or relatives.

Note. The figures shown in this publication for the number of persons unemployed should not be confused with those issued by the Commonwealth Department of Employment and Industrial Relations. These latter figures represent the number of persons registered as unemployed awaiting placement with the Commonwealth Employment Service.

(e) Persons not in the labour force are those who, during the survey week, were not in the categories 'employed' or 'unemployed' as defined above. They include persons who were keeping house (unpaid), attending an educational institution (school, university, etc.), retired, voluntarily inactive, permanently unable to work, inmates of institutions (hospitals, gaols, sanatoria, etc.), trainee teachers, members of contemplative religious orders, and persons whose only activity during the survey week was jury service or unpaid voluntary work for a charitable organisation.

(f) Duration of unemployment is the period from the time the person began looking for work or was stood down to the end of the survey week. Thus, the survey measures the duration of current spells of unemployment rather than completed spells. Periods of unemployment are recorded in

complete weeks and this results in a slight understatement of duration. Average (mean) duration is obtained by dividing the aggregate number of weeks a group has been unemployed by the number of persons in that group.

(g) Unemployed persons classified by industry and occupation. Unemployed persons who had worked full-time for two weeks or more in the last two years are classified according to the industry and occupation of their most recent full-time job.

(h) Marital status. In the labour force survey, persons are classified as married or not married. Marital status is determined from information supplied by the respondent about the individual concerned and, where the person was reported as being married, about the living arrangements of persons usually resident in the household. Marital status does not therefore necessarily reflect legal status. Persons are classified as married if they are reported as being married (including de facto) and their spouse was a usual resident of the household at the time of the survey. The 'not-married' category comprises persons who have never married, or are separated, widowed or divorced, as well as those who, although reported as being married, did not have a spouse who usually lived in the household. Persons who live in a de facto relationship but who do not volunteer this information when asked whether they are married are classified as not married. In conjunction with the revision of estimates back to February 1978 to conform to revised population estimates (see Explanatory Note 6 above), the definition of marital status outlined above was adopted. Consequently, estimates of marital status contained in this publication are not comparable with estimates published before the February 1984 issue of this publication. This revision to the marital status classification was undertaken in two parts. Firstly, for all surveys from February 1978, persons who reported that they were separated were reclassified as not married (previously included as married). Secondly, from June 1983 onwards, in addition to including persons reported as separated, the 'not-married' category includes persons who, although reported as married, did not, at the time of the survey, have a spouse who was a usual resident of the household.

(i) Family status. The family relationship of all persons included in the labour force survey is determined each month, except for:

- i. all persons enumerated in non-private dwellings;
- ii. persons enumerated as visitors to private dwellings; and
- iii. those families enumerated in private dwellings for which it was not possible to obtain information relating to all the usual residents (i.e. families which include a member of the permanent defence forces and families which have one or more of their members away from the usual residence at the time of the survey).

Generally, family status is determined for more than ninety per cent of the civilian population aged 15 and over. A family is defined as consisting of two or more related persons usually resident in the same household at the time of the survey. A family comprises a married couple or a family head (as defined below), together with any persons having any of the following relationships to them:

- i. sons or daughters of any age, if not married and with no children of their own present;
- ii. other relatives if not accompanied by a spouse, sons or daughters, or parents of their own; or
- iii. any children under the age of 15 who do not have a parent present.

A family, as defined, can contain no more than two married persons and can contain two married persons only if these persons are husband and wife (referred to as married-couple families). Other families are families other than married-couple families and comprise one-parent families or other groups of related persons. The family head of an 'other family' is the parent in the case of a one-parent family or, in the case of other groups of related persons, is generally defined as the eldest person in the family. No family head is defined for a married-couple family. Persons are defined as not a member of a family if they are not related to any other member of the household in which they are living. Dependent children comprise all family members under the age of 15, all family members aged 15 to 19 attending school, and all family members aged 15 to 24 who are full-time students. A person is considered to be living alone if he or she is the sole member of a household. The term relationship includes relationships by blood, marriage or adoption.

9. Industry classification. The classification of industry is in accordance with the Australian Standard Industrial Classification (ASIC) described in Australian Standard Industrial Classification, Vol. 1 - The Classification (1983 Edition) (1201.0).

10. Occupation classification. Occupational data are presented for August 1986 on the basis of the Australian Standard Classification of Occupations (ASCO), 1986 (1221.0 and 1222.0), and for earlier periods on the basis of the Classification and Classified List of Occupations (CCLO), Revised November 1980. ASCO relies on the level and specialisation of skill required to satisfactorily perform primary tasks as its classificatory variable and is, therefore, significantly different from the previous classification. Appendix 1 in this publication contains a more detailed explanation of the concepts and structure underlying the classification.

A matrix of the two classifications at the broadest classification level (Major Group), but containing data for Australia, is given in Appendix 1. The estimates contained in the matrix have been derived from a subsample of respondents in the May 1986 labour force survey. The responses to questions on the occupations of employed persons were coded to both ASCO and CCLO classifications and the matrix was produced by cross-classifying ASCO Major Groups by CCLO Major Groups. A similar matrix for N.S.W. and an Australia - level Minor Groups matrix should both be available by the end of December 1986.

11. Regions of New South Wales. The regions used in this publication are standard ABS Statistical Divisions, Subdivisions or Districts (see map inside back cover and Appendix 2 for a list of local government areas in each of these regions), or combinations of these, and do not necessarily correspond with regions adopted by other government authorities. The regions were determined in consultation with major users of the estimates, taking into account the constraints imposed by the structure of the sample design and the need to present reliable statistics (i.e. those not subject to high sampling variability). Two sets of regions are used to present the results. The twelve regions used in Table 13 and Tables 16 to 27 provide summary estimates only, while the five major regions used in Tables 28 to 37 allow the presentation of more detailed estimates. While further unpublished details may be available for

the regions adopted in this publication, estimates for different regions will not be provided. The Sydney Statistical Division is predominantly urban in character - and its boundary was re-delineated in 1976 to embrace the area expected to contain the urban development of Sydney (and associated smaller urban centres) for a period of at least twenty years. This area covers the same area as the 'Sydney Region', as delineated by the State Planning Authority (now the Department of Environment and Planning) in its publication Sydney Region, 1970-2000 A.D., Outline Plan.

12. Reliability of the estimates. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings, they, and the movements derived from them, may differ from figures that would have been obtained if the information had been collected from occupants of all dwellings (using the same questionnaire and interviewing procedures). One measure of the likely difference is given by the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included in the survey. In addition, as noted in Explanatory Note 5 above, the use of benchmarks in the compilation of regional estimates is not possible. For this reason, users should note that regional estimates may be more volatile than corresponding State estimates and thus should not be regarded as reliable indicators of short term (monthly) movements. A Technical Note, showing the likely standard errors relating to sample estimates, is shown at the end of this publication.

### 13. Related publications

(a) Users may also wish to refer to the following related publications which are available on request:

Regional Statistics, New South Wales, 1986  
(1304.1)

Information Paper on the Sources of Labour Statistics (6101.1)

A Guide to Labour Statistics (6102.0)

The Labour Force, Australia (Preliminary Estimates) (6202.0) issued monthly

The Labour Force, Australia (6203.0) issued monthly

The Labour Force, Australia, 1981 (6204.0)  
Information Paper: Questionnaires used in the Labour Force Survey (6232.0)

Employment, Underemployment and Unemployment, Australia, 1966-1983 (6246.0)

Employed Wage and Salary Earners, Australia  
(6248.0) issued quarterly

Information Paper: Release of Regional Labour Force Statistics (6262.0)

Information Paper: Comparison of Employment Estimates from the Labour Force Survey and the Survey of Employment and Earnings  
(6263.0)

(b) In addition to the regular demographic and labour force characteristics which are contained in some of the above publications, supplementary and special surveys of particular aspects of the labour force and of other subjects are carried out from time to time. The results of these surveys are published separately. A complete list of these survey topics and their related publications is contained in Information Paper: Population Surveys, 1960 to 1985 (1115.1) which is available on request to this Office. A list of the more recent releases on labour force and related topics is also contained in The Labour Force, Australia (6203.0) each month. Copies of publications containing supplementary and special survey information are available on request. These may include summary estimates for the regions used in this publication.

(c) Current publications produced by the ABS are listed in the Catalogue of Publications (1101.0) which is available from any ABS Office.

14. In some cases, the ABS can also make available information which is not published (see Explanatory Notes 2 and 11).

JOHN WILSON  
Deputy Commonwealth Statistician

**DIAGRAM 1: NEW SOUTH WALES**

**Note:** Estimates following the break in lines are based on the revised definition of employed persons. See Explanatory Note 6.

**NEW SOUTH WALES**

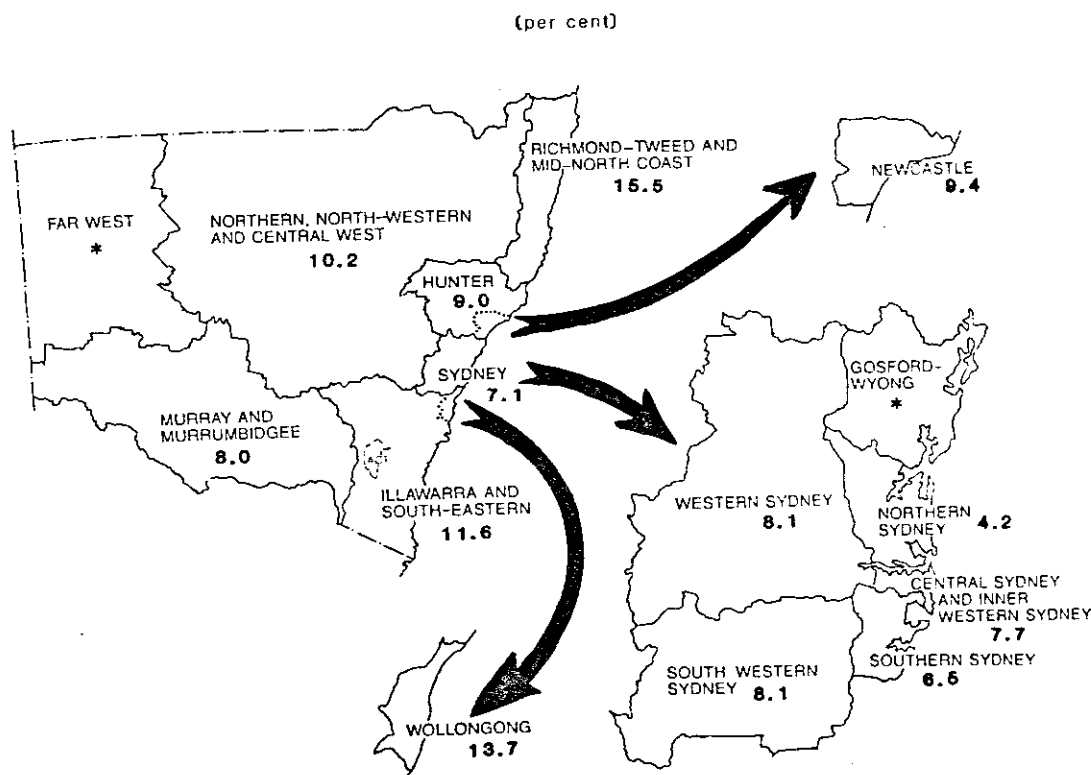

- In August 1986, there were an estimated 2,558,500 persons (1,557,500 males and 1,000,900 females) in the civilian labour force in New South Wales, of whom 2,344,400 (1,430,400 males and 914,000 females) were employed and 214,100 (127,100 males and 86,900 females) were unemployed (see Table 1).
- In August 1986, the labour force participation rate was 60.0 per cent (males 74.4, married females 45.0 and all females 46.2) and the unemployment rate was 8.4 per cent (males 8.2, married females 5.6 and all females 8.7) (see Table 1).
- The August 1986 estimates of 214,100 unemployed persons and an unemployment rate of 8.4 per cent were little different to the May 1986 estimates of 213,600 unemployed persons and an unemployment rate of 8.3 per cent. The number of employed persons in August 1986 was 2,344,400, which represented a significant decrease from the estimate in May 1986 of 2,374,700 persons. (See Table 1.)
- The August 1986 estimate of 214,100 unemployed persons was also little different to the August 1985 estimate of 216,700 unemployed person, but the August 1986 estimated unemployed rate of 8.4 per cent represented an apparent decrease from the August 1985 estimated unemployment rate of 8.7 per cent. Over the period August 1985 to August 1986, the number of persons employed increased significantly by 63,100 (28,800 males and 34,300 females). (See Table 1.)

## SUMMARY OF FINDINGS (continued)

## NEW SOUTH WALES (continued)

- The unemployment rate for persons aged 15 to 19 was 20.0 per cent in August 1986 compared with 19.1 per cent in May 1986 and 19.0 per cent in August 1985 (see Table 9).
- The average duration of unemployment was 59.2 weeks in August 1986 compared with 55.9 weeks in May 1986 and 56.1 weeks in August 1985 (see Table 11).
- From August 1985 to August 1986, the unemployment rate for persons born in Australia remained consistently below that for persons born outside Australia. In August 1986, the unemployment rate for persons born in Australia was 8.1 per cent and for persons born outside Australia 9.0 per cent (8.4 and 9.9 per cent respectively in August 1985). (See Table 12.)

DIAGRAM 2: UNEMPLOYMENT RATES, REGIONS OF  
NEW SOUTH WALES, AUGUST 1986

REGIONS OF NEW SOUTH WALES (Note: Because of the estimation procedures adopted (and the effects of certain aspects of the sample design), estimates for regions other than Sydney Statistical Division and the Balance of New South Wales may be subject to some volatility. As a result, care should be taken when interpreting estimates over short periods - see Explanatory Note 12.)

• During the quarter ending August 1986, the combined Richmond-Tweed and Mid-North Coast Statistical Divisions recorded the highest unemployment rate in the State (peaking at 15.5 per cent in August 1986). The regions which recorded the next highest unemployment rates throughout the quarter were the Wollongong Statistical District (peaking at 14.2 per cent in July 1986) and the combined Illawarra and South-Eastern Statistical Division (peaking at 11.6 per cent in August 1986). During the quarter ending August 1986, the lowest unemployment rate (3.4 per cent in July 1986) was recorded in Northern Sydney Subdivision. (See Table 13.)

• From May 1986 to August 1986, three regions recorded some movement in the number of persons unemployed. One region (the combined Central Sydney and Inner Western Sydney Subdivisions) recorded a significant decrease and two regions (Southern Sydney Subdivision and the combined Richmond-Tweed and Mid-North Coast Statistical Divisions) recorded apparent increases. (See Tables 16 to 27.)

• From August 1985 to August 1986, one region (Western Sydney Subdivision) recorded a significant decrease in the number of persons unemployed and two regions (Northern Sydney Subdivision and the combined Richmond-Tweed and Mid-North Coast Statistical Divisions) recorded apparent increases. (See Tables 16 to 27.)

TABLE 1. LABOUR FORCE STATUS OF THE CIVILIAN POPULATION AGED 15 AND OVER, N.S.W.

39 and under 52	4.5	13.4	7.8	5.1	8.6	6.9	5.3	12.2
52 and under 104	16.0	29.3	29.8	28.8	30.1	17.0	8.5	25.5
104 and over	15.7	48.0	40.7	44.2	40.6	31.3	11.4	42.7
Total	155.1	218.0	213.6	207.7	214.6	127.1	86.9	214.1
	(weeks)							
Average duration of unemployment (d)	35.0	56.1	55.9	59.0	56.3	68.9	45.1	59.2

(a) Aged 15 and over. (b) Period from the time the person began looking for work or was stood down to the end of the survey week. Periods of unemployment are recorded in complete weeks and this results in a slight understatement of duration of unemployment. (c) Estimates from May 1986 are based on the revised definition of employed persons. See Explanatory Note 6. (d) Average duration is obtained by dividing the aggregate number of weeks a group has been unemployed by the number of persons in that group.

Note: Estimates following the break in lines are based on the revised definition of employed persons. See Explanatory Note 6.

### SUMMARY OF FINDINGS

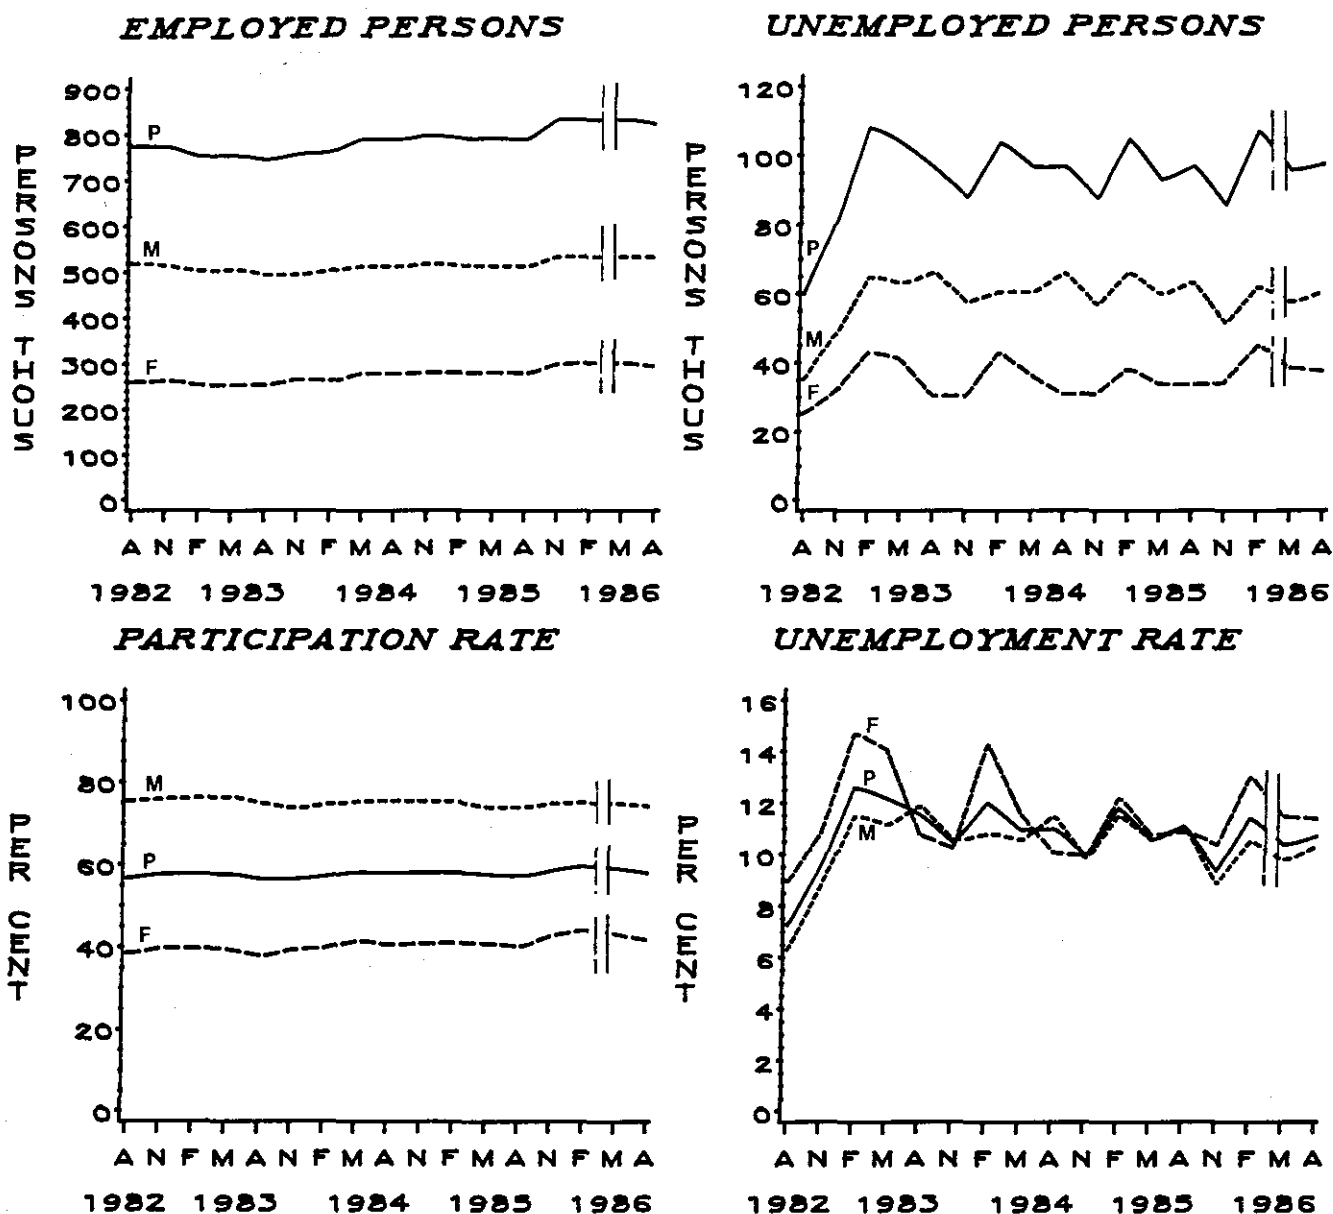

- In August 1986, the number of persons unemployed was 116,500 and the unemployment rate was 7.1 per cent. These estimates were little different to those in May 1986 of 118,300 persons unemployed and an unemployment rate of 7.1 per cent, and to the August 1985 estimate of 121,000 persons unemployed. However, the August 1986 estimated unemployment rate of 7.1 per cent represented an apparent decrease from the August 1985 estimated unemployment rate of 7.5 per cent. The unemployment rate in the Sydney Statistical Division continued to be approximately 1.0 percentage point below that for total New South Wales.
- The number of employed persons in August 1986 was 1,529,200, which represented an apparent decrease from the estimate in May 1986 of 1,546,500 persons, but represented a significant increase on the estimate in August 1985 of 1,486,500 persons. A rise in the number of persons in part-time employment accounted for most of the increase between August 1985 and August 1986. Between May and August 1986, the number of persons in full-time employment decreased by 24,400 persons.

## DIAGRAM 8: BALANCE OF NEW SOUTH WALES

Note: Estimates following the break in lines are based on the revised definition of employed persons. See Explanatory Note 6.

### SUMMARY OF FINDINGS

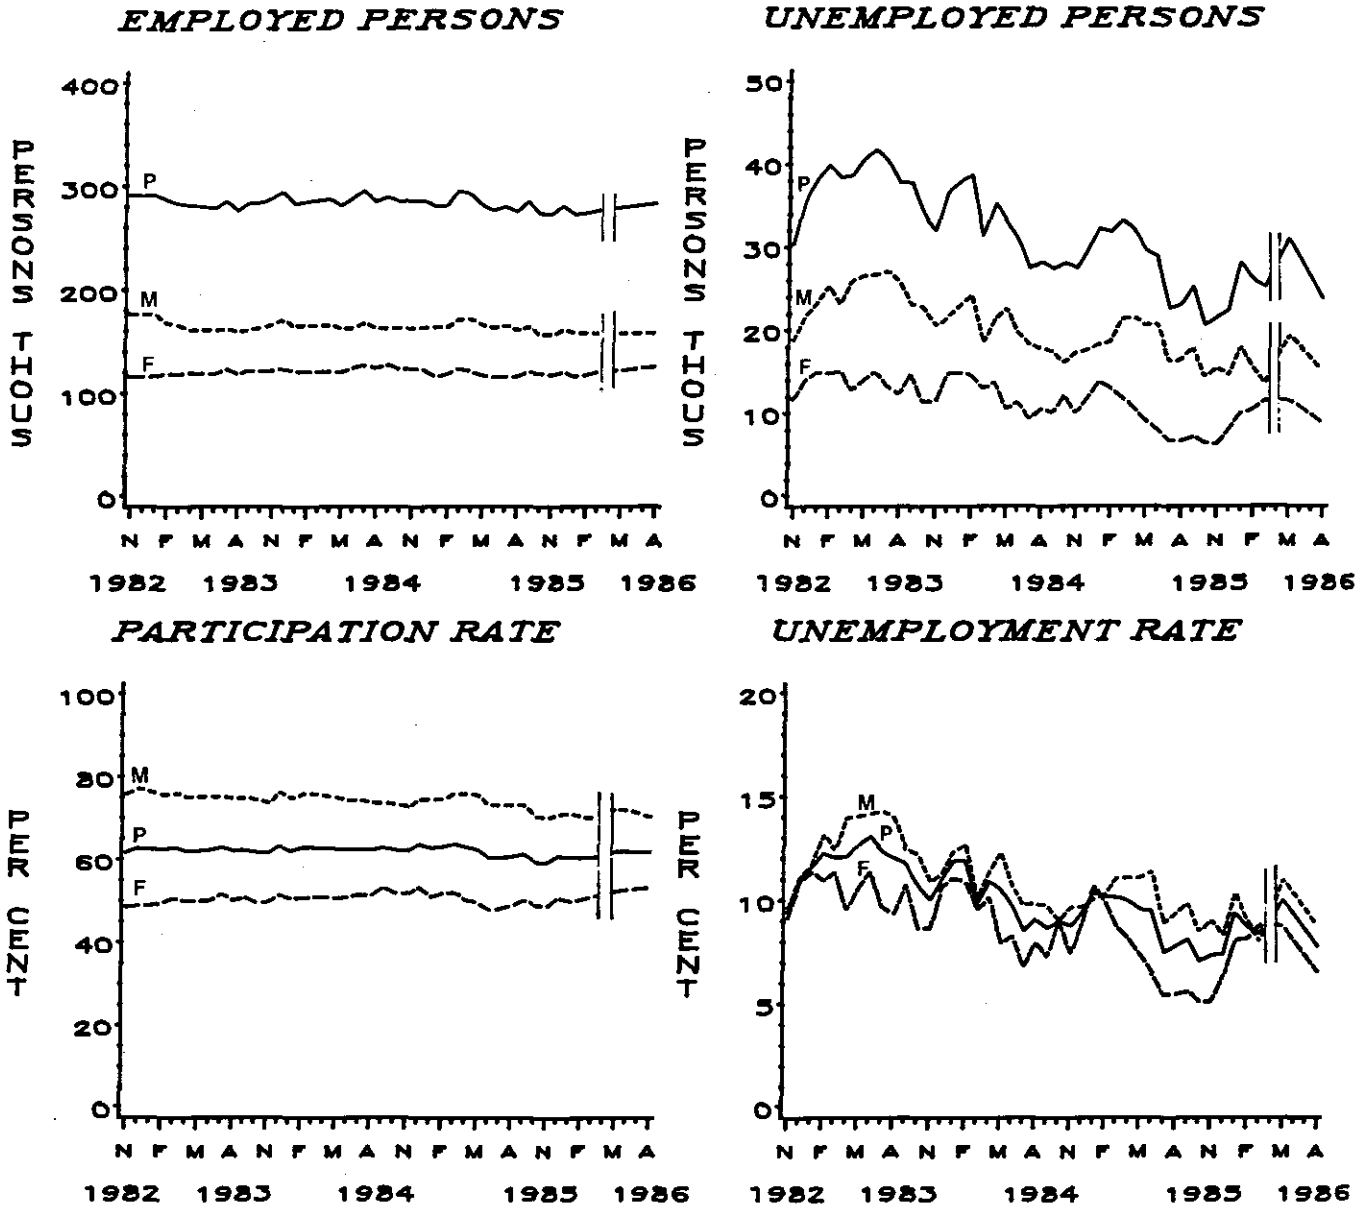

- In August 1986, the number of persons unemployed was 97,600 and the unemployment rate was 10.7 per cent. These estimates were little different to those in May 1986 of 95,300 persons unemployed and an unemployment rate of 10.3 per cent, and to those in August 1985 of 97,000 persons unemployed and an unemployment rate of 11.1 per cent. The unemployment rate in the Balance of New South Wales continued to be approximately 2.0 percentage points above that for total New South Wales.
- The number of employed persons in August 1986 was 815,200, which represented an apparent decrease from the estimate in May 1986 of 828,200, but represented a significant increase on the estimate in August 1985 of 781,000 persons.

SUMMARY OF FINDINGS

- In August 1986, the number of persons unemployed was 23,600 and the unemployment rate was 7.7 per cent. These estimates represented a significant decrease from the estimates in May 1986 of 30,900 unemployed persons and an unemployment rate of 10.0 per cent, but were little different to the estimates in August 1985 of 23,200 unemployed persons and an unemployment rate of 7.8 per cent. In contrast to the majority of regions, the unemployment rate for males in this region is higher, in most months, than that for females.
- The number of employed persons in August 1986 was 282,600, which was little different to the estimates in May 1986 of 278,500 persons and in August 1985 of 272,800 persons.

## SUMMARY OF FINDINGS

- In August 1986, the number of persons unemployed was 20,600 and the unemployment rate was 6.5 per cent. These estimates represented an apparent increase on the estimates in May 1986 of 17,000 unemployed persons and an unemployment rate of 5.2 per cent, but were little different to the August 1985 estimates of 23,100 unemployed persons and an unemployment rate of 6.9 per cent. This region continued to record an unemployment rate below the rate for New South Wales in every month.
- The number of employed persons in August 1986 was 297,600 which represented an apparent decrease from the estimates in May 1986 of 311,800 persons and in August 1985 of 311,800 persons.

## SUMMARY OF FINDINGS

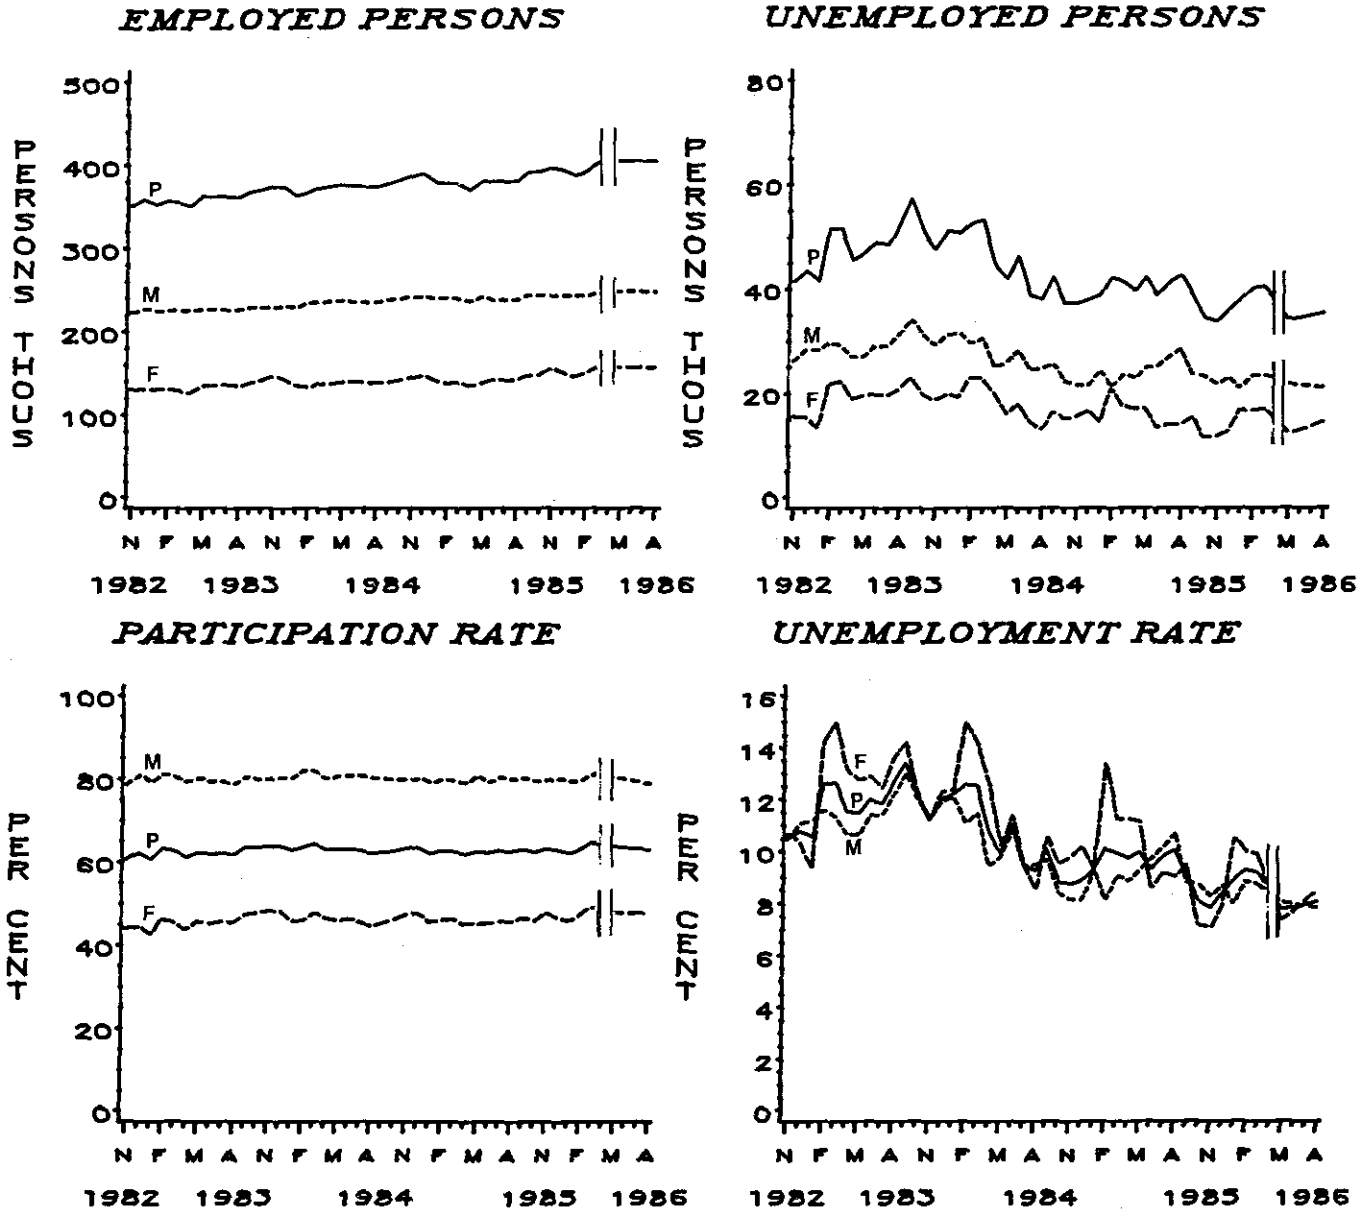

- In August 1986, the number of unemployed persons was 10,600 and the unemployment rate was 8.1 per cent. These estimates were little different to those in May 1986 of 11,200 unemployed persons and an unemployment rate of 8.5 per cent, and to those in August 1985 of 9,100 unemployed persons and an unemployment rate of 7.6 per cent.
- The number of persons employed in August 1986 was 120,600, which was little different to the estimate in May 1986 of 119,600 persons, but represented an apparent increase on the estimate in August 1985 of 110,000 persons.
- The labour force participation rate for this region continued to vary over the 12 months to August 1986. The participation rate in August 1986 was 65.3 per cent, which was 2.9 percentage points below the May 1986 estimate of 68.2 per cent and 1.5 percentage points above the August 1985 estimate of 63.8 per cent.

### SUMMARY OF FINDINGS

- In August 1986, the number of persons unemployed was 35,400 and the unemployment rate was 8.1 per cent. These estimates were little different to those in May 1986 of 33,900 unemployed persons and an unemployment rate of 7.7 per cent, but represented a significant decrease from the estimates in August 1985 of 42,600 unemployed persons and an unemployment rate of 10.1 per cent. A decrease in the number of males looking for full-time work (6,400) accounted for most of the decrease between August 1985 and August 1986.
- The number of employed persons in August 1986 was 403,300, which was little different to the estimate in May 1986 of 405,000 persons, but represented a significant increase on the estimate in August 1985 of 380,200 persons. A rise in the number of females employed (14,100) accounted for most of the increase between August 1985 and August 1986.

#### SUMMARY OF FINDINGS

- In August 1986, the number of unemployed persons was 16,100 and the unemployment rate was 4.2 per cent. These estimates were little different to those in May 1986 of 15,100 unemployed persons and an unemployment rate of 4.0 per cent. The August 1986 estimate of 16,100 unemployed persons represented an apparent increase on the August 1985 estimate of 13,600 unemployed persons, but the August 1986 estimated unemployment rate of 4.2 per cent was little different to the August 1985 estimated unemployment rate of 3.7 per cent. This region continued to record the lowest unemployment rate in New South Wales in every month.
- The number of employed persons in August 1986 was 363,200, which was little different to the estimate in May 1986 of 362,500 persons, but represented an apparent increase on the estimate in August 1985 of 351,900 persons.

## SUMMARY OF FINDINGS

- In August 1986, the number of persons unemployed was 18,200 and the unemployment rate was 9.4 per cent. These estimates were little different to the estimates in May 1986 of 16,400 unemployed persons and an unemployment rate of 8.6 per cent, and to those in August 1985 of 20,000 unemployed persons and an unemployment rate of 10.5 per cent. The number of females unemployed in August 1986 (9,000) represented an apparent increase on the estimate in May 1986 (7,100).
- The number of persons employed in August 1986 was 175,500, which was little different to the estimates in May 1986 of 175,300 persons, and in August 1985 of 169,900 persons.

## SUMMARY OF FINDINGS

- In August 1986, the number of unemployed persons was 20,000 and the unemployment rate was 9.0 per cent. These estimates were little different to those in May 1986 of 19,000 unemployed persons and an unemployment rate of 8.6 per cent, and to those in August 1985 of 22,800 unemployed persons and an unemployment rate of 10.1 per cent. The number of females unemployed in August 1986 (9,200) represented an apparent increase on the estimate in May 1986 (7,400).
- In August 1986, the number of employed persons was 203,800, which was little different to the estimates in May 1986 of 202,000 persons and in August 1985 of 203,400 persons.

## SUMMARY OF FINDINGS

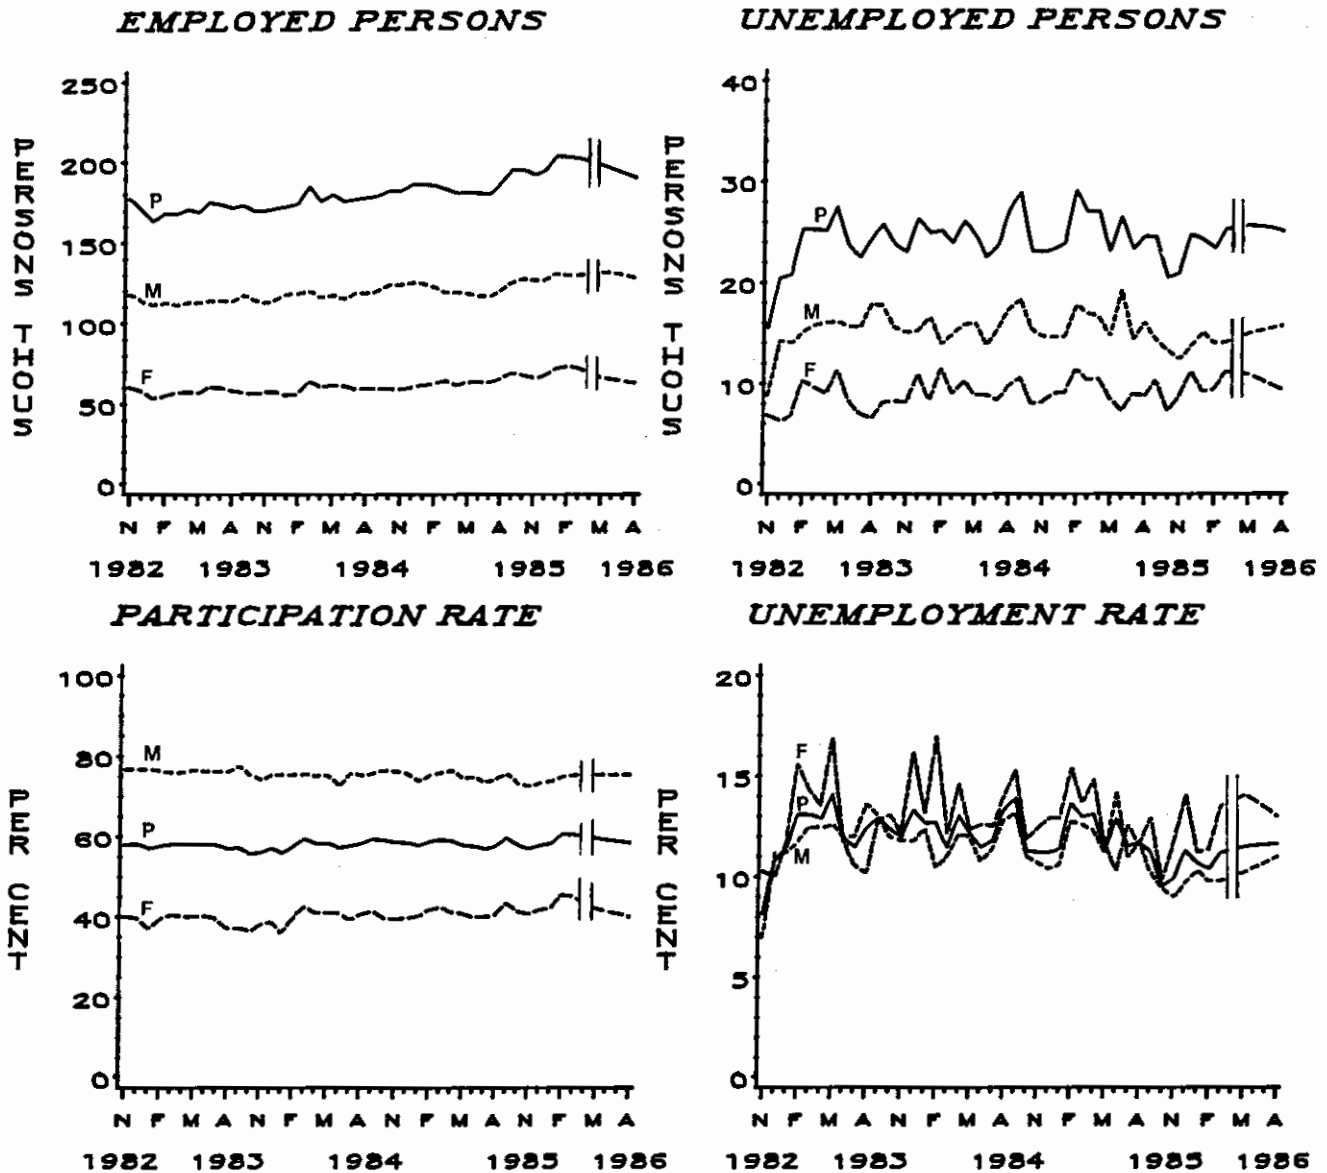

- In August 1986, the number of persons unemployed was 15,400 and the unemployment rate was 13.7 per cent. These estimates were little different to those in May 1986 of 15,400 unemployed persons and an unemployment rate of 12.8 per cent, and to those in August 1985 of 16,000 unemployed persons and an unemployment rate of 13.8 per cent. The Wollongong Statistical District continued to record one of the highest unemployment rates in New South Wales.
- The number of employed persons in August 1986 was 97,000 which represented an apparent decrease from the estimate in May 1986 of 105,300 persons, but was little different to the estimate in August 1985 of 99,900 persons.

### SUMMARY OF FINDINGS

- In August 1986, the number of persons unemployed was 24,900 and the unemployment rate was 11.6 per cent. These estimates were little different to those in May 1986 of 25,700 unemployed persons and an unemployment rate of 11.5 per cent, and to those in August 1985 of 24,500 unemployed persons and an unemployment rate of 11.6 per cent. This region recorded one of the highest unemployment rates in New South Wales throughout the period from August 1985 to August 1986.
- The number of employed persons in August 1986 was 189,000, which represented an apparent decrease from the estimate in May 1986 of 197,300 persons, but was little different to the estimate in August 1985 of 186,400 persons.

#### SUMMARY OF FINDINGS

- In August 1986, the number of persons unemployed was 22,900 and the unemployment rate was 15.5 per cent. This estimate of 22,900 unemployed persons represented an apparent increase on the May 1986 estimate of 20,200 unemployed persons, and on the August 1985 estimate of 19,500 unemployed persons. However, the August 1986 estimated unemployment rate of 15.5 per cent was little different to the May 1986 estimated unemployment rate of 14.3 per cent, and to the August 1985 estimated unemployment rate of 15.9 per cent. This region continued to record one of the highest unemployment rates in New South Wales.
- The number of employed persons in August 1986 was 125,000, which was little different to the estimate in May 1986 of 121,200 persons, but represented a significant increase on the estimate in August 1985 of 103,100 persons.
- The participation rate in August 1986 was 55.2 per cent compared with a rate of 50.1 per cent in August 1985. The labour force participation rate for this region has continued to be the lowest in New South Wales.

### **SUMMARY OF FINDINGS**

- In August 1986, the number of persons unemployed was 20,800 and the unemployment rate was 10.2 per cent. These estimates were little different to those in May 1986 of 20,300 unemployed persons and an unemployment rate of 9.8 per cent, and to those in August 1985 of 20,400 unemployed persons and an unemployment rate of 10.0 per cent.
- The number of employed persons in August 1986 was 183,500, which was little different to the estimate in May 1986 of 186,100 persons, and in August 1985 of 183,500 persons.

### EMPLOYED PERSONS

### UNEMPLOYED PERSONS

### PARTICIPATION RATE

### UNEMPLOYMENT RATE

Notes 1: Estimates following the break in lines are based on the revised definition of employed persons. See Explanatory Note 6.

2: An asterisk (\*) indicates that the estimate for the period is subject to sampling variability too high for most practical purposes.

#### SUMMARY OF FINDINGS

- In August 1986, the number of persons unemployed was 8,900 and the unemployment rate was 8.0 per cent. These estimates were little different to those in May 1986 of 9,300 unemployed persons and an unemployment rate of 8.0 per cent, and to those in August 1985 of 9,000 unemployed persons and an unemployment rate of 8.9 per cent. In most months, this region recorded the lowest unemployment rate outside the Sydney Statistical Division.
- The number of employed persons in August 1986 was 102,100, which was little different to the estimate in May 1986 of 106,800 persons, but represented an apparent increase on the estimate in August 1985 of 91,400 persons.

(e) Comprises Salespersons and Personal Service Workers, and Plant and Machine Operators, and Drivers. (f) See Explanatory Note 8 (c) ii.

### Estimation procedure

1. The labour force estimates are derived from the monthly population survey by use of a complex ratio estimation procedure. This procedure ensures that the survey estimates conform to an independently estimated distribution of the population by age and sex, rather than to the age and sex distribution within the sample itself.

### Reliability of the estimates

2. Two types of error are possible in an estimate based on a sample survey: sampling error and non-sampling error. The sampling error is a measure of the variability that occurs by chance because a sample, rather than the entire population, is surveyed. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings, the estimates and the movements derived from them are subject to sampling variability; that is, they may differ from the figures that would have been obtained if all dwellings had been included in the survey. One measure of the likely difference is given by the standard error which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included and about nineteen chances in twenty that the difference will be less than two standard errors. The standard error can also be expressed as a percentage of the estimate, and this is known as the relative standard error.

3. Space does not allow for the separate indication of the standard errors of all estimates in this publication. Standard errors of estimates derived from the survey and of monthly, quarterly and annual movements (except those movements spanning September/October 1982), for New South Wales and for each region of New South Wales, can be determined by reference to the table commencing on page 68. Details of the standard errors of monthly, quarterly and annual movements spanning September/October 1982 were published in the November 1983 issue of this publication.

4. The size of the standard error increases with the level of the estimate, so that the larger the estimate the larger the standard error. However, it should be noted that the larger the sample estimate, the smaller will be the standard error in percentage terms. Thus, larger sample

estimates will be relatively more reliable than smaller estimates.

5. As the standard errors in the following table show, the smaller the estimate the higher is the relative standard error. Very small estimates are subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most practical purposes. In the tables in this publication, estimates with a relative standard error of greater than 25 per cent and percentages based on such estimates have not been included and have been replaced with an asterisk (\*). Although figures for these small components can in some cases be derived by subtraction, they should not be regarded as reliable.

6. The movement in the level of an estimate is also subject to sampling variability. The standard error of the movement depends on the levels of the estimates from which the movement is obtained rather than the size of the movement. An indication of the magnitude of standard errors of monthly movements is also given in the following table. The estimates of standard errors of monthly movements apply only to estimates of movements between two consecutive months. Movements between corresponding months of consecutive quarters (quarterly movements), corresponding months of consecutive years (annual movements) and other non-consecutive months will generally be subject to somewhat greater sampling variability than is indicated in column 3 of the following table. Standard errors of quarterly movements can be obtained by multiplying the figures shown in column 1 of the following table by 1.11. Standard errors of quarterly movements calculated this way will not necessarily agree with those obtained by multiplying the figures in column 3 by 1.5, which was the method shown in issues of this publication prior to May 1986. Standard errors of all annual movements can be obtained by multiplying the figures shown in column 1 of the table by 1.3. When using the table to calculate standard errors of movements, refer to the larger of the two estimates from which the movement is derived.

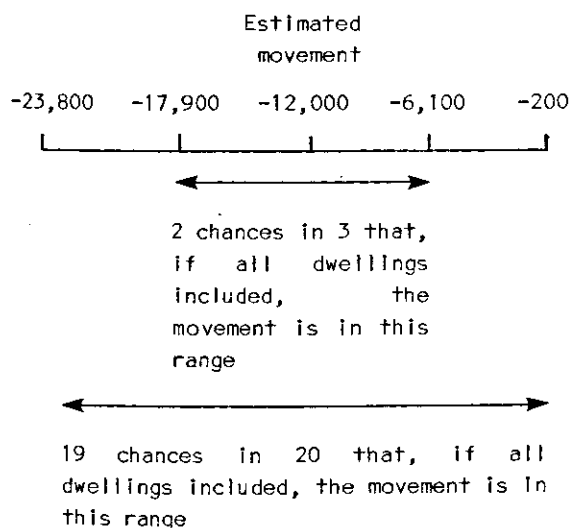

7. Examples of the calculation and use of standard errors are given below:

(a) From column 1 of the following table, it can be seen that the estimate of 552,300 employed married females in New South Wales in August 1986 (see Table 1) has a standard error of approximately 7,400 (by interpolation). There are about two chances in three that the true figure that would have

been obtained if all dwellings had been included in the survey would have been within the range 544,900 to 559,700 and about nineteen chances in twenty that it would have been within the range 537,500 to 567,100.

- (b) The estimate of movement in the number of employed married females in New South Wales from July to August 1986 is a decrease of 12,000 (see Table 1). Column 3 in the following table can be used to determine the standard error of the monthly movement for the larger of the two estimates from which the movement is derived. In this case, the July 1986 estimate (564,300) is the larger. From column 3 for New South Wales, it can be seen that the standard error of the monthly movement is approximately 5,900 (by interpolation). There are about two chances in three that if all dwellings had been included in the surveys the movement would have been in the range -17,900 to -6,100 and about nineteen chances in twenty that it would have been in the range -23,800 to -200.

8. The standard errors of estimates relating to agricultural employment are generally somewhat higher than the standard errors of other estimates of the same magnitude.

9. The relative standard errors of estimates of average duration of unemployment are obtained by first finding the relative standard error of the estimate of the total number of persons contributing to the estimate (see column 2 in the following table) and then multiplying the figure so obtained by 1.3.

10. The reliability of an estimated percentage or rate, computed by using sample data for both numerator and denominator, depends upon both the size of the numerator and the size of the denominator. The formula for the relative standard error (RSE) of a percentage or rate is given below:

$$RSE(x/y) = \sqrt{[RSE(x)]^2 + [RSE(y)]^2}.$$

11. Standard errors contained in the following table are designed to provide an average standard error applicable for all monthly labour force survey estimates. Recent analysis of the standard errors for New South Wales applicable to particular survey estimates has shown that the standard errors for estimates of employment are generally equivalent to those shown in the following table, but standard errors for estimates of unemployment and for persons not in the labour force are approximately 6 per cent and 10 per cent (respectively) higher than those shown in the table.

12. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by respondents, errors made in collection such as in recording and coding of data, and errors made in processing the data. Inaccuracies of this kind are referred to as non-sampling errors. They may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce non-sampling errors to a minimum by careful design of questionnaires, intensive training and supervision of interviewers, and efficient operating procedures.

1,000,000				12,000	1.2	6,200			

(a) See Technical Note 6 for details on calculating standard errors for quarterly and annual movements.

1. This appendix contains a brief description of the new occupation classification used in the labour force survey from August 1986. The classification is known as the Australian Standard Classification of Occupations (ASCO).

2. The ABS is also using ASCO for the 1986 Population Census and for other collections obtaining occupational data. In addition, other organisations and individuals which are collecting, coding and publishing information and statistics in Australia with an occupational content are being encouraged to use ASCO to ensure comparability with ABS statistics.

3. More detailed information on the ASCO classification and structure is contained in the ASCO Statistical Classification (1222.0).

#### Reasons for developing ASCO

4. It had been widely recognised by users in industry and government that previous occupation classifications used in Australia suffered from a number of deficiencies.

These included:

- (a) a lack of comparability between the different classifications used by various institutions;
- (b) a lack of balance and inappropriate structures of aggregations across the classifications;
- (c) an absence of occupational descriptions and characteristics such as training requirements;
- (d) the existence of occupational categories that combined widely different jobs (for example, jobs requiring different skill levels);
- (e) the inclusion of obsolete categories and inadequate treatment of occupations in new fields;
- (f) insufficient occupational categories at the lowest levels of the classifications; and
- (g) occupational definitions and categories frequently in industry specific items.

5. These deficiencies had been highlighted by a number of official committees and, against this background, the ABS and the (Commonwealth) Department of Employment and Industrial Relations (DEIR) decided to develop a standard classification of occupations and a dictionary of occupations, occupational titles and descriptions.

#### The ASCO structure

6. Following detailed consideration of users' needs, the ABS and DEIR concluded that the final ASCO structure should be based on 'kind of work', defined primarily in terms of skill level and

skill specialisation. There are a number of reasons for this emphasis:

- (a) The inability to identify significant skill concentrations within the labour force has been one of the major limitations of existing occupational classifications.
- (b) It is consistent with current concerns that a key focus of labour force policy and planning should be on the acquisition and enhancement of skills.
- (c) Alternative criteria (such as materials worked on and products/services produced) result in an occupational classification structure with a significant 'industry' orientation. Industry data are already supplied by the use of a separate classification (ASIC), whereas occupational skill level and skill specialisation are not provided by any of the existing classifications.

7. The structure of ASCO has four levels, namely:

- (a) Major Group;
- (b) Minor Group;
- (c) Unit Group; and
- (d) Occupation.

Each of these levels can be briefly described as follows:

- (a) Major Groups. There are 8 Major Groups which represent the broadest level of the classification. Major Groups are denoted by a single digit code and are distinguished from each other on the basis of skill level.
- (b) Minor Groups. There are 52 Minor Groups. Each Minor Group is a subdivision of the Major Group. These Minor Groups are denoted by a 2-digit code consisting of the relevant Major Group code, plus an additional digit. Minor Groups are distinguished from other Minor Groups in the same Major Group on the basis of broadly-stated skill specialisation.
- (c) Unit Groups. There are 282 Unit Groups. Each is a subdivision of a Minor Group. Unit Groups are denoted by a 4-digit code consisting of the relevant Minor Group code, plus 2 additional digits. Unit Groups are distinguished from other Unit Groups in the same Minor Group on the basis of a fine degree of skill specialisation.
- (d) Occupations. There are 1,079 Occupations that subdivide the Unit Groups. Occupations are denoted by a 6-digit code consisting of the relevant Unit Group code, plus a hyphen and 2 additional digits. Occupations are sets of jobs

## APPENDIX 1. AUSTRALIAN STANDARD CLASSIFICATION OF OCCUPATIONS (ASCO) (continued)

which involve the performance of a common set of tasks and are distinguished from other occupations within the same Unit Group on the basis of skill levels and specialisation.

8. The following example illustrates these conventions:

LEVEL	CODE	TITLE
Major group	2	Professionals
Minor group	28	Artists and Related Professionals
Unit group	2805	Designers and Illustrators
Occupation	2805-13	Graphic Designer

9. For the purposes of coding occupation data in the labour force survey, a four digit code is applied. This code represents details of the third level (Unit Group) of ASCO. For a further illustration of the structure and format of ASCO, a description of the Major and Minor Groups is shown on page 73.

10. The following table provides a comparison for May 1986 (at the Australia level) of occupations classified in accordance with the new ASCO classification and the previously used CCLO classification. See Explanatory Note 10 for a description of how this table was derived.

EMPLOYED PERSONS : COMPARISON OF ASCO (a) CLASSIFICATION OF OCCUPATIONS AND CCLO (b) CLASSIFICATION OF OCCUPATIONS, MAY 1986 (c), AUSTRALIA ('000)

Occupation (CCLO) (b)	Occupation (ASCO) (a)								Total

(a) Classified in accordance with the Australian Standard Classification of Occupations (ASCO).

(b) Classified in accordance with the Classification and Classified List of Occupations (CCLO), Revised November 1980. (c) See Explanatory Note 10.

## ASCO MAJOR AND MINOR GROUP STRUCTURE

1	MANAGERS AND ADMINISTRATORS	46	Vehicle Tradespersons
11	Legislators and Government Appointed Officials	47	Food Tradespersons
12	General Managers	48	Amenity Horticultural Tradespersons
13	Specialist Managers	49	Miscellaneous Tradespersons
14	Farmers and Farm Managers	5	CLERKS
15	Managing Supervisors (Sales and Service)	51	Stenographers and Typists
16	Managing Supervisors (Other Business)	52	Data Processing and Business Machine Operators
2	PROFESSIONALS	53	Numerical Clerks
21	Natural Scientists	54	Filing, Sorting and Copying Clerks
22	Building Professionals and Engineers	55	Material Recording and Despatching Clerks
23	Health Diagnosis and Treatment Practitioners	56	Receptionists, Telephonists and Messengers
24	School Teachers	59	Miscellaneous Clerks
25	Other Teachers and Instructors	6	SALESPERSONS AND PERSONAL SERVICE WORKERS
26	Social Professionals	61	Investment, Insurance and Real Estate
27	Business Professionals Salespersons	62	Sales Representatives
28	Artists and Related Professionals	63	Sales Assistants
29	Miscellaneous Professionals	64	Tellers, Cashiers and Ticket Salespersons
3	PARA-PROFESSIONALS	65	Miscellaneous Salespersons
31	Medical and Science Technical Officers and Technicians	66	Personal Service Workers
32	Engineering and Building Associates and Technicians	7	PLANT AND MACHINE OPERATORS, AND DRIVERS
33	Air and Sea Transport Technical Workers	71	Road and Rail Transport Drivers
34	Registered Nurses	72	Mobile Plant Operators (Except Transport)
35	Police	73	Stationary Plant Operators
39	Miscellaneous Para-Professionals	74	Machine Operators
4	TRADESPERSONS	8	LABOURERS AND RELATED WORKERS
41	Metal Fitting and Machining Tradespersons	81	Trades Assistants and Factory Hands

PUBLICATIONS ISSUED BY AUSTRALIAN BUREAU OF STATISTICS (NEW SOUTH WALES OFFICE)

The Deputy Commonwealth Statistician issues a large range of publications presenting statistics relating to New South Wales. All of these are obtainable from the Australian Bureau of Statistics, St. Andrew's House, Sydney Square (George Street, next to Sydney Town Hall), Sydney.

The New South Wales Year Book presents a comprehensive statistical survey of the social, demographic, and economic structure and growth of the State, and describes the legislative provisions and administrative arrangements which are of significance for a proper interpretation and analysis of the statistics of the State. The Pocket Year Book and New South Wales in Brief contain a wide range of statistical and other material in compact form and are useful for handy reference. More recent statistics are available in the Monthly Summary of Statistics. The Regional Statistics presents a selection of the more important statistics available for geographical areas of the State. More detailed statistics relating to matters treated generally in the above publications are available in the various Subject Bulletins, which range from preliminary monthly statements to detailed bulletins presenting the results of periodic censuses, etc. The date of release and current price of the more important bulletins issued by this Office appears below.

Catalogue No.	Publication	Month of issue	Price (\$)	
			Excl. postage	Incl. postage
1300.1	New South Wales Year Book, No. 70, 1986 (softcover)	May 1986	27.50	30.70
